

Make sure you have removed the USB cable from the scanner before configuring the channel

1. Scan “\$RF#CH02”, scanner will start to have dididi.... sound.
2. Plug USB dongle into your computer, the dididi... sound will stop immediately.
(Configure successfully)

If you have several scanners that all required to pair the channel.

Make sure you have scanned different channel for each scanner, otherwise there will be interference when you use them at the same time.
